## Autonomous driving (case study)

LATEST SUBMISSION GRADE

100%

To help you practice strategies for machine learning, in this week we'll present another scenario and ask how
you would act. We think this "simulator" of working in a machine learning project will give a task of what leading
a machine learning project could be like!

1/1 point

You are employed by a startup building self-driving cars. You are in charge of detecting road signs (stop sign, pedestrian crossing sign, construction ahead sign) and traffic signals (red and green lights) in images. The goal is to recognize which of these objects appear in each image. As an example, the above image contains a pedestrian crossing sign and red traffic lights

Your 100,000 labeled images are taken using the front-facing camera of your car. This is also the distribution of data you care most about doing well on. You think you might be able to get a much larger dataset off the internet, that could be helpful for training even if the distribution of internet data is not the same.

You are just getting started on this project. What is the first thing you do? Assume each of the steps below would take about an equal amount of time (a few days).

- Spend a few days checking what is human-level performance for these tasks so that you can get an accurate estimate of Bayes error.
- Spend a few days collecting more data using the front-facing camera of your car, to better understand how much data per unit time you can collect.
- O Spend a few days getting the internet data, so that you understand better what data is available.
- Spend a few days training a basic model and see what mistakes it makes.

## ✓ Corre

As discussed in lecture, applied ML is a highly iterative process. If you train a basic model and carry out error analysis (see what mistakes it makes) it will help point you in more promising directions.

Your goal is to detect road signs (stop sign, pedestrian crossing sign, construction ahead sign) and traffic signals (red and green lights) in images. The goal is to recognize which of these objects appear in each image. You plan to use a deep neural network with ReLU units in the hidden layers. 1 / 1 point

For the output layer, a softmax activation would be a good choice for the output layer because this is a multitask learning problem. True/False?

○ True

False

✓ Correct

Softmax would be a good choice if one and only one of the possibilities (stop sign, speed bump, pedestrian crossing, green light and red light) was present in each image.

You are carrying out error analysis and counting up what errors the algorithm makes. Which of these datasets do you think you should manually go through and carefully examine, one image at a time? 1 / 1 point

- 500 images on which the algorithm made a mistake
- 0 10,000 randomly chosen images

\_

	10,000 images on which the algorithm made a mistake     500 randomly chosen images
	Correct Focus on images that the algorithm got wrong. Also, 500 is enough to give you a good initial sense of the error statistics. There's probably no need to look at 10,000, which will take a long time.
4.	After working on the data for several weeks, your team ends up with the following data:
	100,000 labeled images taken using the front-facing camera of your car.
	900,000 labeled images of roads downloaded from the internet.
	• Each image's labels precisely indicate the presence of any specific road signs and traffic signals or combinations of them. For example, $y^{(i)} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \\ 0 \end{bmatrix}$ means the image contains a stop sign and a red traffic light.
	Because this is a multi-task learning problem, you need to have all your $y^{(i)}$ vectors fully labeled. If one example is equal to $\begin{bmatrix} 0 \\ ? \\ 1 \\ 1 \\ ? \end{bmatrix}$ then the learning algorithm will not be able to use that example. True/False?  True  False
	o raise
	Correct  As seen in the lecture on multi-task learning, you can compute the cost such that it is not influenced by the fact that some entries haven't been labeled.
5.	The distribution of data you care about contains images from your car's front-facing camera; which comes from a different distribution than the images you were able to find and download off the internet. How should you split the dataset into train/dev/test sets?
	Choose the training set to be the 900,000 images from the internet along with 80,000 images from your car's front-facing camera. The 20,000 remaining images will be split equally in dev and test sets.
	Mix all the 100,000 images with the 900,000 images you found online. Shuffle everything. Split the 1,000,000 images dataset into 600,000 for the training set, 200,000 for the dev set and 200,000 for the test set.
	Mix all the 100,000 images with the 900,000 images you found online. Shuffle everything. Split the 1,000,000 images dataset into 980,000 for the training set, 10,000 for the dev set and 10,000 for the test set.
	Choose the training set to be the 900,000 images from the internet along with 20,000 images from your car's front-facing camera. The 80,000 remaining images will be split equally in dev and test sets.
	Correct Yes. As seen in lecture, it is important that your dev and test set have the closest possible distribution to "real"-data. It is also important for the training set to contain enough "real"-data to avoid having a data-mismatch problem.
6.	Assume you've finally chosen the following split between of the data:

6.

Dataset:	Contains:	Error of the algorithm:
Training	940,000 images randomly picked from (900,000 internet images + 60,000 car's front-facing camera images)	8.8%
Training- Dev	20,000 images randomly picked from (900,000 internet images + 60,000 car's front-facing camera images)	9.1%
Dev	20,000 images from your car's front-facing camera	14.3%
Test	20,000 images from the car's front-facing camera	14.8%

You also know that human-level error on the road sign and traffic signals classification task is around 0.5%. Which of the following are True? (Check all that apply).

You have a large variance problem because your model is not generalizing well to data from the same training distribution but that it has never seen before

You have a large variance problem because your training error is quite higher than t	he human-level error.	
Your algorithm overfits the dev set because the error of the dev and test sets are ver	ry close.	
_		
You have a large avoidable-bias problem because your training error is quite a bit his error.	gher than the human-lev	rel
✓ Correct		
You have a large data-mismatch problem because your model does a lot better on the dev set	he training-dev set than (	on
✓ Correct		
Based on table from the previous question, a friend thinks that the training data distribution than the dev/test distribution. What do you think?	tion is much easier	1/1 point
O Your friend is right. (I.e., Bayes error for the training data distribution is probably low distribution.)	ver than for the dev/test	
O Your friend is wrong. (i.e., Bayes error for the training data distribution is probably h distribution.)	igher than for the dev/te	st
There's insufficient information to tell if your friend is right or wrong.		
Correct The algorithm does better on the distribution of data it trained on. But you don't on that no distribution or if it really is easier. To get a better sense, measure hum		
both distributions.

		True, deep learning algorithms	s are quite robust to having slightly dif	terent train and dev distributions.	

12. So far your algorithm only recognizes red and green traffic lights. One of your colleagues in the startup is starting to work on recognizing a yellow traffic light. (Some countries call it an orange light rather than a yellow light; we'll use the US convention of calling it yellow.) Images containing yellow lights are quite rare, and she describes a countries and the property leaves and the property leaves

1/1 point

	What do you tell your colleague?
	She should try using weights pre-trained on your dataset, and fine-tuning further with the yellow-light dataset.
	If she has (say) 10,000 images of yellow lights, randomly sample 10,000 images from your dataset and put your and her data together. This prevents your dataset from "swamping" the yellow lights dataset.
	O You cannot help her because the distribution of data you have is different from hers, and is also lacking the yellow label.
	Recommend that she try multi-task learning instead of transfer learning using all the data.
	Correct Yes. You have trained your model on a huge dataset, and she has a small dataset. Although your labels are different, the parameters of your model have been trained to recognize many characteristics of road and traffic images which will be useful for her problem. This is a perfect case for transfer learning, she can start with a model with the same architecture as yours, change what is after the last hidden layer and initialize it with your trained parameters.
13.	Another colleague wants to use microphones placed outside the car to better hear if there're other vehicles around you. For example, if there is a police vehicle behind you, you would be able to hear their siren. However, they don't have much to train this audio system. How can you help?
	Transfer learning from your vision dataset could help your colleague get going faster. Multi-task learning seems significantly less promising.
	Multi-task learning from your vision dataset could help your colleague get going faster. Transfer learning seems significantly less promising.
	C Either transfer learning or multi-task learning could help our colleague get going faster.
	Neither transfer learning nor multi-task learning seems promising.
	Correct Yes. The problem he is trying to solve is quite different from yours. The different dataset structures make it probably impossible to use transfer learning or multi-task learning.
14.	<ul> <li>(A) Input an image (x) to a neural network and have it directly learn a mapping to make a prediction as to whether there's a red light and/or green light (y).</li> <li>A teammate proposes a different, two-step approach:</li> <li>(B) In this two-step approach, you would first (i) detect the traffic light in the image (if any), then (ii) determine the color of the illuminated lamp in the traffic light.</li> <li>Between these two, Approach B is more of an end-to-end approach because it has distinct steps for the input end and the output end. True/False?</li> <li>True</li> <li>False</li> <li>Correct  Yes. (A) is an end-to-end approach as it maps directly the input (x) to the output (y).</li> </ul>
15.	Approach A (in the question above) tends to be more promising than approach B if you have a (fill in the blank).  1/1 point  1/1 point  1/1 point  1/1 point  1/1 point  1/2 point  1/3 point  1/4 point  1/4 point  1/5 point  1/6 point  1/7 point
	Correct Yes. In many fields, it has been observed that end-to-end learning works better in practice, but requires a large
